Shree Pharma

Setup guide: website and email dashboard

Follow the parts in order, on a computer. Every step says what to click and what you should see. Nothing here costs money until the domain in Part 9.

What you are setting up

Piece	What it does
Your website	The product catalogue with brochure download, quote form and WhatsApp button. Quote requests go straight into your dashboard.
Your dashboard	A private app at `/app`, on your phone and PC, behind your password. Import CSV leads, approve emails, see replies and quote requests.
Outreach Gmail	A second Gmail just for cold emails. Drafts are saved there, sent from there, and replies arrive there.
Main Gmail	shreepharma.in@gmail.com. Gets an alert when a buyer replies or sends a quote request.

The parts

1. Outreach Gmail (5 minutes)
2. GitHub: put the code online (10 minutes)
3. Cloudflare: one-click deploy (10 minutes)
4. First login and phone icon (5 minutes)
5. Google Cloud: allow the dashboard to use Gmail (25 minutes)
6. Your settings and a test email (5 minutes)
7. Test with your own email addresses (10 minutes)
8. Go live and daily routine
9. Later: your domain shreepharmaglobal.com

Screens can look slightly different from what is written here, because Cloudflare, GitHub and Google change their pages from time to time. If a button name does not match or something fails, take a screenshot and send it to Claude.

Part 1: Outreach Gmail

Time: 5 minutes **Where:** accounts.google.com

Cold emails go out from a separate Gmail, so your main business inbox is never put at risk.

1. Open a **private (incognito) window** in Chrome: press **Ctrl + Shift + N**.
2. Go to `accounts.google.com/signup`.
3. Create the account with your real name. Choose an address like `shreepharma.sales@gmail.com`.
4. Add your phone number when asked, for account recovery.
5. Write the address and password down somewhere safe.

Check: you can open Gmail with the new account and see an empty inbox.

Part 2: GitHub, to put the code online

Time: 10 minutes **Where:** github.com **You need:** shree-pharma-app.zip

Cloudflare reads your code from GitHub. You upload it once, by dragging files into the browser.

1. Go to `github.com/signup` and create a free account with **shreepharma.in@gmail.com**. Verify the email code GitHub sends.
2. On your computer, right-click **shree-pharma-app.zip** and choose **Extract All**, then **Extract**. A folder called **shree-pharma-app** opens.
3. In GitHub, click the **+** at the top right, then **New repository**.
4. Repository name: `shree-pharma`. Choose **Public** (Cloudflare's one-click deploy needs this; the code holds no passwords). Leave everything else as it is. Click **Create repository**.
5. On the next page, click the link **uploading an existing file**.
6. Open the extracted **shree-pharma-app** folder. Click inside it, press **Ctrl + A** to select everything inside, and drag it all into the GitHub upload box.
7. Wait until every file has finished uploading, then click **Commit changes**.

Check: your repository page lists `package.json`, `wrangler.toml`, `README.md` and the folders `public` and `src` at the top level. If you see only one folder called `shree-pharma-app`, you dragged the folder instead of its contents: delete the repository (Settings, bottom of the page) and repeat steps 3 to 7.

Write down your repository address. It looks like `https://github.com/YOUR-NAME/shree-pharma`.

Part 3: Cloudflare one-click deploy

Time: 10 minutes **Where:** Cloudflare **Cost:** free, no card needed

1. In your browser address bar, type this, replacing **YOUR-NAME** with your GitHub name, and press Enter: `https://deploy.workers.cloudflare.com/?url=https://github.com/YOUR-NAME/shree-pharma`
2. Sign up for (or log in to) Cloudflare with **shreepharma.in@gmail.com**. Verify your email if asked.
3. When asked, connect your **GitHub** account and allow Cloudflare access. Cloudflare makes its own copy of your repository in your GitHub; that is normal, and that copy is the one it deploys from.
4. If asked to pick a **workers.dev subdomain**, choose something short like `shreepharma`.
5. Keep the project name `shree-pharma`. Keep the suggested database name `shree-pharma-db`.
6. Fill in the three secret boxes:
   - **ADMIN_PASSWORD**: your dashboard password. At least 12 characters, for example three random words and a number. Write it down.
   - **GOOGLE_CLIENT_ID**: type `add-later`
   - **GOOGLE_CLIENT_SECRET**: type `add-later`
7. Click **Create and deploy** (or **Deploy**). Building takes 1 to 3 minutes.

Check: Cloudflare shows a success message and an address like `https://shree-pharma.shreepharma.workers.dev`. Open it: you see your website. Write this address down; it is your site until your domain is ready.

If the build fails: open the build log, take a screenshot of the red lines and send it to Claude. Nothing is lost; it can be fixed and deployed again.

Part 4: First login and phone icon

Time: 5 minutes

1. Open your address with `/app` at the end, for example `https://shree-pharma.shreepharma.workers.dev/app`.
2. Enter your ADMIN_PASSWORD and click **Log in**. You stay logged in for 30 days on each device.
3. **On your iPhone:** open the same address in **Safari**, log in, tap **Share**, then **Add to Home Screen**, then **Add**.
4. **On Android:** open it in **Chrome**, log in, tap the menu (three dots), then **Add to Home screen**.

Check: the dashboard opens with a yellow banner saying "Connect your outreach Gmail to start". That is expected; Part 5 fixes it.

If the login page says **Setup is not finished** or **password too short**: in Cloudflare open **Workers & Pages** > **shree-pharma** > **Settings** > **Variables and Secrets**, and add or edit the secret **ADMIN_PASSWORD**.

Part 5: Google Cloud, so the dashboard can use Gmail

Time: 25 minutes **Where:** console.cloud.google.com **Cost:** free

Do all of Part 5 signed in as your OUTREACH Gmail, not your main one. Use the private window from Part 1, or switch account at the top right of Google pages.

A. Create the project and turn on Gmail

1. Go to `console.cloud.google.com`. Accept the terms (country: India).
2. Click the project picker at the top left (it may say **Select a project**), then **New project**. Name it `Shree Pharma` and click **Create**. When it finishes, make sure **Shree Pharma** is selected at the top.
3. In the search bar at the top, type `Gmail API`, click the result **Gmail API**, then click **Enable**.

B. The sign-in screen (Google Auth Platform)

1. Open the menu (≡) at the top left, then **Google Auth Platform** (older name: **APIs & Services > OAuth consent screen**). Click **Get started**.
2. **App information:** App name `Shree Pharma`. User support email: your outreach Gmail. Click **Next**.
3. **Audience:** choose **External**. Click **Next**.
4. **Contact information:** your outreach Gmail. Click **Next**.
5. Tick the box to agree to the policy, click **Continue**, then **Create**.
6. In the left menu click **Data access**, then **Add or remove scopes**. In the filter box type `gmail.modify`, tick the row ending in `/auth/gmail.modify`, click **Update**, then **Save**.
7. In the left menu click **Audience**. Under **Publishing status** click **Publish app**, then **Confirm**. The status must say **In production**.

Do not skip step 7. If the app stays in "Testing", Google disconnects Gmail every 7 days. "In production" without Google's review is fine for your own use.

C. The keys for your dashboard

1. Open your dashboard on the computer: **Settings** tab > **Gmail connection** > **Setup details for Google Cloud**. Copy the address shown. It ends in `/app/oauth/callback`.
2. Back in Google, left menu **Clients**, then **Create client**.
3. Application type: **Web application**. Name: `Shree Pharma Dashboard`.
4. Under **Authorized redirect URIs** click **Add URI** and paste the address from step 1. It must match exactly. Click **Create**.

5. A box shows the **Client ID** and **Client secret**. Click **Download JSON** as a backup, and keep the box open. **Google may show the secret only this once.**

D. Put the keys into Cloudflare

1. In Cloudflare open **Workers & Pages** > **shree-pharma** > **Settings** > **Variables and Secrets**.
2. Next to **GOOGLE_CLIENT_ID** click edit, replace `add-later` with the Client ID (it ends with `.apps.googleusercontent.com`), and save or deploy.
3. Do the same for **GOOGLE_CLIENT_SECRET** with the Client secret.
4. Both must have the type **Secret**. If you had to add them fresh, choose type **Secret**, not Text.

E. Connect Gmail

1. In the dashboard, open **Settings** and reload the page. Click **Connect Gmail**.
2. Choose your **outreach** Gmail.
3. Google says **"Google hasn't verified this app"**. This is normal for your own app. Click **Advanced**, then **Go to Shree Pharma (unsafe)**.
4. Allow access (tick the box if one is shown) and click **Continue**.

Check: you land back on Settings and it says **Connected to** your outreach Gmail. The top of the dashboard shows that address in green.

If you see this	Do this
Error 400: redirect_uri_mismatch	The redirect address in Google does not exactly match. Repeat C1 and C4, copying the address again.
"Google keys are missing" in Settings	Part D: the two secrets are not saved yet, or still say add-later.
Access blocked or invalid client	Check you used the outreach Gmail for both Google Cloud and Connect, and that D2 and D3 hold the right values.
"Google did not give lasting access"	Go to `myaccount.google.com/permissions` (outreach Gmail), remove Shree Pharma, then Connect again.

Part 6: Your settings and a test email

Time: 5 minutes **Where:** dashboard > Settings

1. **Your name:** how you sign emails, for example `Shivam` or your full name.
2. **Send alerts to:** `shreepharma.in@gmail.com` (already filled in).
3. **Business postal address:** your registered business address. Required by US law in marketing emails, and the dashboard keeps reminding you until it is filled in.
4. **Website address** and **Brochure link:** leave both empty. They fill in automatically.
5. **Emails per day:** keep **20** for the first week.
6. Read both email templates. Change any wording you like, but keep the words in `{{double brackets}}` spelled exactly. Use **Preview** to see a filled-in example.
7. Click **Save settings**.
8. At the top of Settings, click **Send me a test email**.

Check: your main inbox receives an email starting with **[TEST]**, written exactly like a real cold email, and the brochure link in it opens the PDF.

Part 7: Test with your own email addresses

Time: 10 minutes

1. In Excel or Google Sheets, make a sheet with these columns in row 1: `Email`, `First Name`, `Company`, `Country`.
2. Add 3 rows using email addresses **you** can open: your personal Gmail, a family member's, a friend's. Save it as **CSV** (File > Save As > CSV, or File > Download > CSV).
3. Dashboard > **Leads** > **Import leads from CSV** > choose the file > **Import leads**. It reports 3 new leads added.
4. **Home** > **Create drafts now**. The 3 emails appear under **Approve and send**. Tap a name to read it. They are also in the outreach Gmail's **Drafts** folder.
5. Tap **Send selected**. Check the 3 inboxes. Look in Spam too, and if one landed there, mark it "Not spam".
6. Reply to one of them from your personal email, with any text.
7. Back on **Home**, tap **Check replies now**. It shows 1 new reply, the lead moves to **Recent replies**, and your main inbox gets an alert.
8. Open your website (your address without `/app`), fill in the quote form with your own details and send it. It appears under **Enquiries** and your main inbox gets an alert.
9. Clean up: **Leads**, tap each test lead, set the status to **Do not contact**, **Save**.

All 9 steps worked? Your system is fully working.

Part 8: Go live and the daily routine

Import your real leads

Leads > choose a CSV > type the country for that file if it has no country column > **Import leads**. Any CSV with an email column works. Duplicates, people already in your list, unsubscribed people and rows without a valid email are skipped automatically.

What happens by itself

When	What
Weekdays from 9 AM IST	Drafts are prepared in your outreach Gmail, up to your daily limit. Follow-ups come first.
About 9:30 AM IST	An email to your main inbox: "Ready to approve".
Every 10 minutes	About 3 approved emails go out, and new replies, bounces and unsubscribes are picked up.
4 business days after a first email	If there is no reply, one follow-up is drafted in the same email thread for you to approve.
When a buyer replies	An alert to your main inbox; the lead shows as Replied and any waiting follow-up is cancelled.

Your 10 minutes a day

1. Open the dashboard from the icon on your phone.
2. **Approve and send:** untick anyone you do not want, tap **Send selected**.
3. Answer replies from the outreach Gmail app (**Recent replies** > **Open**), and quote requests under **Enquiries**.
4. When a buyer orders, open the lead and set the status to **Client**.

Raise the daily limit slowly

Week	1	2	3	4	after
Emails per day	20	35	50	70	up to 90

If many emails bounce, or nobody replies for two weeks, lower the limit and check your lead lists. To stop everything at once, tap **Pause sending** on Home.

Good to know

- You can edit a draft in the Gmail app before approving it. Your edited version is what gets sent.
- Sending a draft yourself from the Gmail app also works. The dashboard notices within 10 minutes.

- **Download CSV** on the Leads tab saves a full copy of your leads, which works as a backup. Do it monthly.
- To change your password: Cloudflare > shree-pharma > Settings > Variables and Secrets > ADMIN_PASSWORD. Every device is logged out.

Part 9: Later, your domain shreepharmaglobal.com

Time: 20 minutes, plus up to a day of waiting **Cost:** about ₹1,000 a year

A. Buy it on GoDaddy

1. On GoDaddy, search `shreepharmaglobal.com` and add it to the cart. Choose **1 year**.
2. **Remove every add-on:** hosting, website builder, Microsoft 365 email, SSL, domain protection. You need none of them.
3. Check the **renewal price** at checkout, then pay.

B. Hand the domain to Cloudflare (free)

1. In Cloudflare, on the account home page, click **Add a domain** (may say **Onboard a domain**). Type `shreepharmaglobal.com`, continue, and choose the **Free** plan.
2. Cloudflare shows **two nameservers**, like `xxx.ns.cloudflare.com`. Keep that page open.
3. In GoDaddy: **My Products** > your domain > **DNS** > **Nameservers** > **Change nameservers** > **I'll use my own nameservers**. Paste both Cloudflare nameservers and save. Confirm any warning.
4. Wait. Cloudflare emails you when the domain is active, usually within an hour, at most a day.

C. Point it at your site

1. Cloudflare > **Workers & Pages** > **shree-pharma** > **Settings** > **Domains & Routes** > **Add** > **Custom domain**. Type `shreepharmaglobal.com` and add it.
2. Repeat with `www.shreepharmaglobal.com`.
3. In Google Cloud (outreach Gmail) > **Google Auth Platform** > **Clients** > your client > **Authorized redirect URIs** > **Add URI** > `https://shreepharmaglobal.com/app/oauth/callback` > **Save**.
4. Open `https://shreepharmaglobal.com/app` and log in. From now on, every email links to your domain automatically.
5. Replace the phone icon: delete the old one and add the new address to your home screen as in Part 4.

Check: `https://shreepharmaglobal.com` shows your website with a padlock, and the dashboard's Settings says "Now using: https://shreepharmaglobal.com" under Website address. Gmail stays connected; you do not need to reconnect it.
